SP Marketplace

SP Safety at Combifloat

As a leading provider of modular floating and self-elevating marine construction systems, Combifloat continuously invests in operational excellence, safety, and standardization across its global fleet and project portfolio. As part of this commitment, the company sought a digital solution to efficiently record, manage, and track safety observations, inspections, and corrective actions across its nearshore and offshore assets.

With Microsoft 365 and SharePoint already in use across the business, Combifloat turned to SP Marketplace and implemented SP Safety as part of its existing Microsoft environment. The solution supports the recording and management of safety observations and workflow-based corrective actions, helping mitigate potential risks before they become incidents. This supports Combifloat's objective of maintaining the highest safety standards while supporting a growing international operation.

At a glance

Company: Combifloat Systems B.V.
Challenge: As a leading provider of modular floating and self-elevating marine construction systems, Combifloat continuously invests in operational excellence, safety, and standardization across its global fleet and project portfolio. As part of this commitment, the company sought a digital solution to efficiently record and manage safety observations, incidents, inspections, and corrective actions across its nearshore and offshore operations, both between contracts and while supporting clients' operations. This enables safety information to be captured and followed up throughout the operational lifecycle, helping to identify and mitigate potential risks. With Microsoft 365 and SharePoint already in use across the business, Combifloat also sought a solution that could build on its existing familiarity with the Microsoft platform
Suggested Application: SP Safety
Outcome: Seamless Integration, Expectations Exceeded

THE CHALLENGE

With Microsoft 365 and SharePoint already established within the business, Combifloat sought a safety management solution that could integrate into its existing Microsoft environment while meeting its specific operational requirements.

The challenge was to establish a consistent and accessible way of recording and managing safety observations, incidents and inspections across Combifloat's nearshore and offshore operations, both between contracts and while supporting clients' operations. Personnel working in the field needed a practical means of reporting safety information, while the organization required a structured way to assign, manage and follow up corrective actions through to completion.

Combifloat also needed greater visibility of reported safety information through centralized records, dashboards and reporting, while retaining the flexibility to adapt the system to its specific processes and evolving operational needs. The objective was therefore not simply to digitize safety reporting, but to establish a standardized process that could support proactive risk management across a growing international operation.

Francesco Pettinà, Engineering Coordinator at Combifloat Systems B.V.

"We already subscribed to Microsoft (Office) 365. We already had experience with Microsoft SharePoint in other areas of our global operation, and ideally: we wanted our new safety management system to fit straight into the Microsoft platform we already knew.

SP Marketplace, with their UK based team were not only able to deliver us a safety management system that was built on Microsoft, but SP Safety delivered us a software solution that was able to meet our needs today and grow with our business in the future. SP Safety is simple to use, built using standard out-of-the-box Microsoft technology that enables our own in-house team to configure and tweak the software to meet our specific needs, of course supported by the SP Marketplace team who operate globally, just like us."

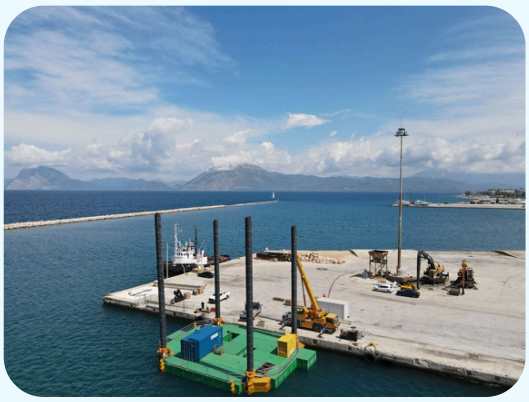
SP Safety at Combifloat

combifloat

THE SOLUTION



Combifloat Systems B.V. chose SP Marketplace, and SP Safety, as their safety management software vendor in April 2026.

Because SP Safety would be installed on Combifloat's own Microsoft (Office) 365 tenancy, within SharePoint Online, Combifloat were able to provide all their users with a software solution that ran on mobile and tablet devices for platform onsite work, supported by a back-office desktop and laptop web-enabled application that was familiar and therefore easy to use.

At the core of SP Safety is a software solution focused on recording safety observations, along with workflow-based task management in a bid to mitigate and rectify safety observations before they become a potential safety incident.

At the heart of Combifloat's list of requirements was a software-based safety management solution that could be tweaked (customized) to meet their very specific needs as a high-asset-value provider of nearshore and offshore platforms.

SP Safety

A pre-built solution on Microsoft (Office) 365.

SP Safety is an out-of-the-box Environmental Health & Safety (EHS) solution built on Microsoft (Office) 365 using SharePoint, Teams and the Power Platform. It covers safety observations, incident tracking, hazard identification, compliance documentation and action management, all operating natively in your existing Microsoft environment.

Key Benefits:

- **Observations & Incidents:** Record safety observations and track incidents and hazards from first report through to resolution.
- **Workflow-Based Tasks:** Assign and track actions for incident resolution, hazard correction and inspections.
- **Mobile Ready:** Capture information on mobile and tablet devices onsite, backed by a familiar web-based back office.
- **Dashboards & Reporting:** Powerful dashboard visualization and reporting through the Microsoft 365 Power Platform.
- **Microsoft Native:** Runs in your own Microsoft 365 tenant, so your in-house team can configure it to fit your business without outside development.
